

## **Evalueserve Interview Experience**

The first round was an hour long online aptitude test. It had 60 questions in three sections of aptitude, logical and reasoning with no negative marking.

The candidates who passed the test were called for interviews a day after.

There were two round of interviews. The first round was both technical and hr. You should always design your resume according to the company you are sitting for and be well-versed with it. They asked me about my projects in detail which i answered with the STAR(Situation, Task, Action, Result) approach. They also presented me with situations like if a client wanted a summary of information spread over three Excel sheets, then how would I handle the situation. This was followed by technical questions on polymorphism, inheritance etc. They were majorly interested in my graph analytics project in R and I had an idea about both the language and the project so answered it likewise.

The next round was with the technical lead and just had a single question to code: Finding the number of working dates between two given dates. I told him my logic with a few testcases to handle. And that was it.
