

Evalueserve Interview Experience

The first round was an hour long online aptitude test conducted by co-cubes. It had 60 questions in three sections: aptitude, logical and reasoning with no negative marking.

After the aptitude test 16 students were selected from Msc for the Interview.

There were two round of interviews. The first round was both technical and hr. He asked me to introduce myself, I talked about my research project on social network analysis and then he started asking technical questions based on the project. He asked me to give a real life example where I can use graph analysis and how would I do it. I took the example of WhatsApp and explained. After that there were basic questions on Clustering and Classification. Questions on R, python and machine learning(I had a basic idea so I was able to build on that).

After this he asked me two basic puzzles: Mixed Jar, Frog and the Well.

He also discussed about my work during my Internship and where do I see myself in 5 years.

The next round was with the technical lead and it had a single question: Finding the number of working days between two given dates. I wrote down the code and explained my logic. There were some questions regarding location and commuting to Gurgaon. I think the key here was the confidence and firmness with which you can handle the questions.
